Recommendations to Prevent Methicillin-Resistant *Staphylococcus Aureus* (MRSA) Skin Infection among Football Players

- Individuals with an infection involving drainage (e.g. pus drainage) should be excluded from participation until no drainage is present and the wound can be adequately covered with a bandage and clothing. If a wound cannot be covered adequately, players with potentially infectious skin lesions (as determined by a physician) should continue to be excluded from practice, competition, lifting weights, or sharing facilities with others. Their return to practice or other activities should only be allowed when the lesions are healed and drainage or other signs of MRSA infection have resolved as documented by a licensed physician.

- Encourage all athletes to seek professional medical care for wounds that appear infected and to comply fully with their doctor’s recommendations.

- Require good hygiene at all times, particularly frequent hand washing with soap or alcohol-based hand sanitizers.

- Require mandatory showering and thorough washing by all participants with an antibacterial soap such as Hibiclens® or an equivalent before and after practice or competition for a minimum of one month.

- Do not allow players to share towels or other personal items (e.g. clothing, equipment, balms, or lubricants).

- Require that participants have clean clothing and equipment prior to all practices, games, or workouts. Clothing and equipment should be laundered using a weak bleach solution after each use.

- Non-washable gear (e.g. helmets, shoulder pads) should be wiped down with alcohol after each use.

- Clean and disinfect other shared facilities and surfaces daily (e.g. weights, weight room surfaces, locker room surfaces, training equipment, etc.) with an antibacterial solution with demonstrated activity against *Staphylococcus aureus*.

- Ensure that disinfectant is prepared to the proper use concentration and that this working solution remains on surfaces for the recommended contact time.

- Encourage athletes to use a towel or clothing to act as a barrier between shared equipment and bare skin (e.g. weight and locker room benches, training tables).

- Provide personal skin protection with pads or bandaging to prevent superficial skin trauma.

- Assess all participants for active skin lesions prior to all practices, games, or workouts. Pre-participation inspection should only be performed by knowledgeable and qualified individuals who can readily recognize potentially infectious lesions.

- Encourage athletes to report skin lesions to coaches, trainers, team physicians, or their healthcare provider immediately.

- Any cut or break in the skin (e.g. turf burns, skin trauma, shaving injury) should be washed immediately with soap and water and then covered with a clean, dry dressing. Wounds should then be washed and covered on a daily basis, before and after participation in practice, games, or any other use of sports facilities.
